

Advanced Python Programming

TTPS4850

Creating Variables

```
x = 5
```

Creating Variables

`x = 5`

Creating Variables

```
x = 5  
y = x
```

Creating Variables

```
x = 5  
y = x
```

Creating Variables

```
x = 5  
y = x  
x = 10
```

Creating Variables

```
x = 5  
y = x  
x = 10
```

Creating Variables

```
x = 5  
y = x  
x = 10  
y = 15
```

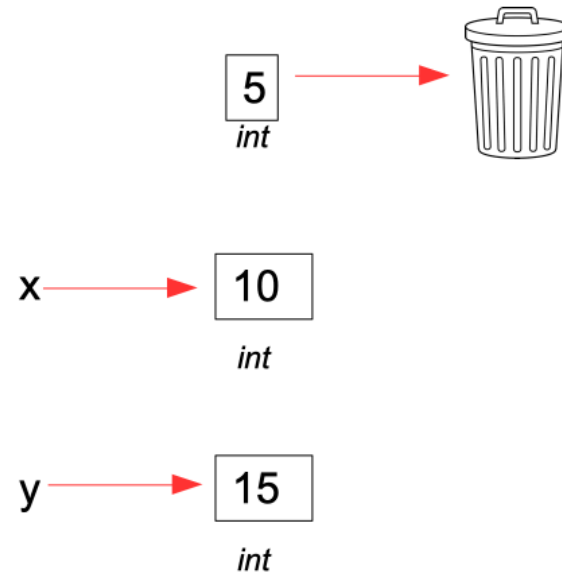

Creating Variables

```
x = 5  
y = x  
x = 10  
y = 15
```

Creating Variables

```
x = 5  
y = x  
x = 10  
y = 15
```

String literals

- Three flavors
 - single-delimited
 - triple-delimited
 - raw

Single-delimited

- Use either single or double quote character

```
"spam\n"  
'spam\n'
```

```
print("Guido's the bomb!")  
print('Guido is the "benevolent" dictator of Python')
```

Triple-delimited

- Single or double quote character
- No need to escape quotes

```
"""spam\n"""  
'''spam\n'''  
  
query = """  
    select *  
    from logs  
    where date > '2018-02-19'  
"""  
  
print(''Guido's the "benevolent" dictator of Python'')
```

Raw

- Does not interpret backslashes

```
r"spam\n"  
r'spam\n'
```

Sequences

```
colors = ['purple', 'orange', 'black']  
print(colors[1])    # prints 'orange'  
for color in colors:  
    print(color)
```

Slices

0	W	1	O	2	M	3	B	4	A	5	T	6
---	---	---	---	---	---	---	---	---	---	---	---	---

```
s = "WOMBAT"
```

```
s[0:3]      # first 3 characters "WOM"  
s[:3]       # same, using default start of 0 "WOM"  
s[1:4]      # s[1] through s[3] "OMB"  
s[3:6]      # s[3] through end "BAT"  
s[3:len(s)] # s[3] through end "BAT"  
s[3:]       # s[3] through end, using default end "BAT"
```

Dictionary

- Key/value pairs
- Keys must be immutable
 - str
 - int, float
 - tuple
- Keys are unique
- Keys/values stored in insertion order

Dictionary items

```
for key, value in _DICT_.items():  
    ... # use key or value here
```

Reading Text Files

```
with open("somefile") as file_in:
```

Reading one line at a time

```
with open("somefile") as file_in:  
    for raw_line in file_in:  
        ...
```

Reading one line at a time

```
with open("somefile") as file_in:  
    for raw_line in file_in:  
        ...
```

Reading one line at a time

```
with open("somefile") as file_in:  
    for raw_line in file_in:  
        ...
```

Reading one line at a time

```
with open("somefile") as file_in:  
    for raw_line in file_in:  
        ...
```

Reading entire file into string

```
with open("somefile") as file_in:  
    contents = file_in.read()
```

Reading file into list of strings (with EOL)

```
with open("somefile") as file_in:  
    all_lines = file_in.readlines()
```

Reading file into list of strings (without EOL)

```
with open("somefile") as file_in:  
    all_lines = file_in.read().splitlines()
```

str to bytes

bytes to str

Lists vs Tuples

Lists	Tuples
Dynamic array	Collection of related fields
Mutable/unhashable	Immutable/hashable
Position doesn't matter	Position matters
Use case: iterating	Use case: indexing or unpacking
"ARRAY"	"STRUCT" or "RECORD"

A Myth

Tuples are just read-only lists

Tuple alternatives

- Standard library
 - namedtuple
 - dataclass
- Third-party
 - attrs
 - Pydantic

Sorting

Numbers

`n, n, n, ...`

Strings

`"C1C2C3", "C1C2C3", "C1C2C3",`

Nested iterables

`[obj1, obj2, obj3], [obj1, obj2, obj3],`

Dictionary elements

`(key, value), (key, value), (key, value),`

Sequence Comprehensions

- list comprehension

```
[EXPR for VAR ... in ITERABLE if CONDITION]
```

- generator expression

```
(EXPR for VAR ... in ITERABLE if CONDITION)
```

Mapping Comprehensions

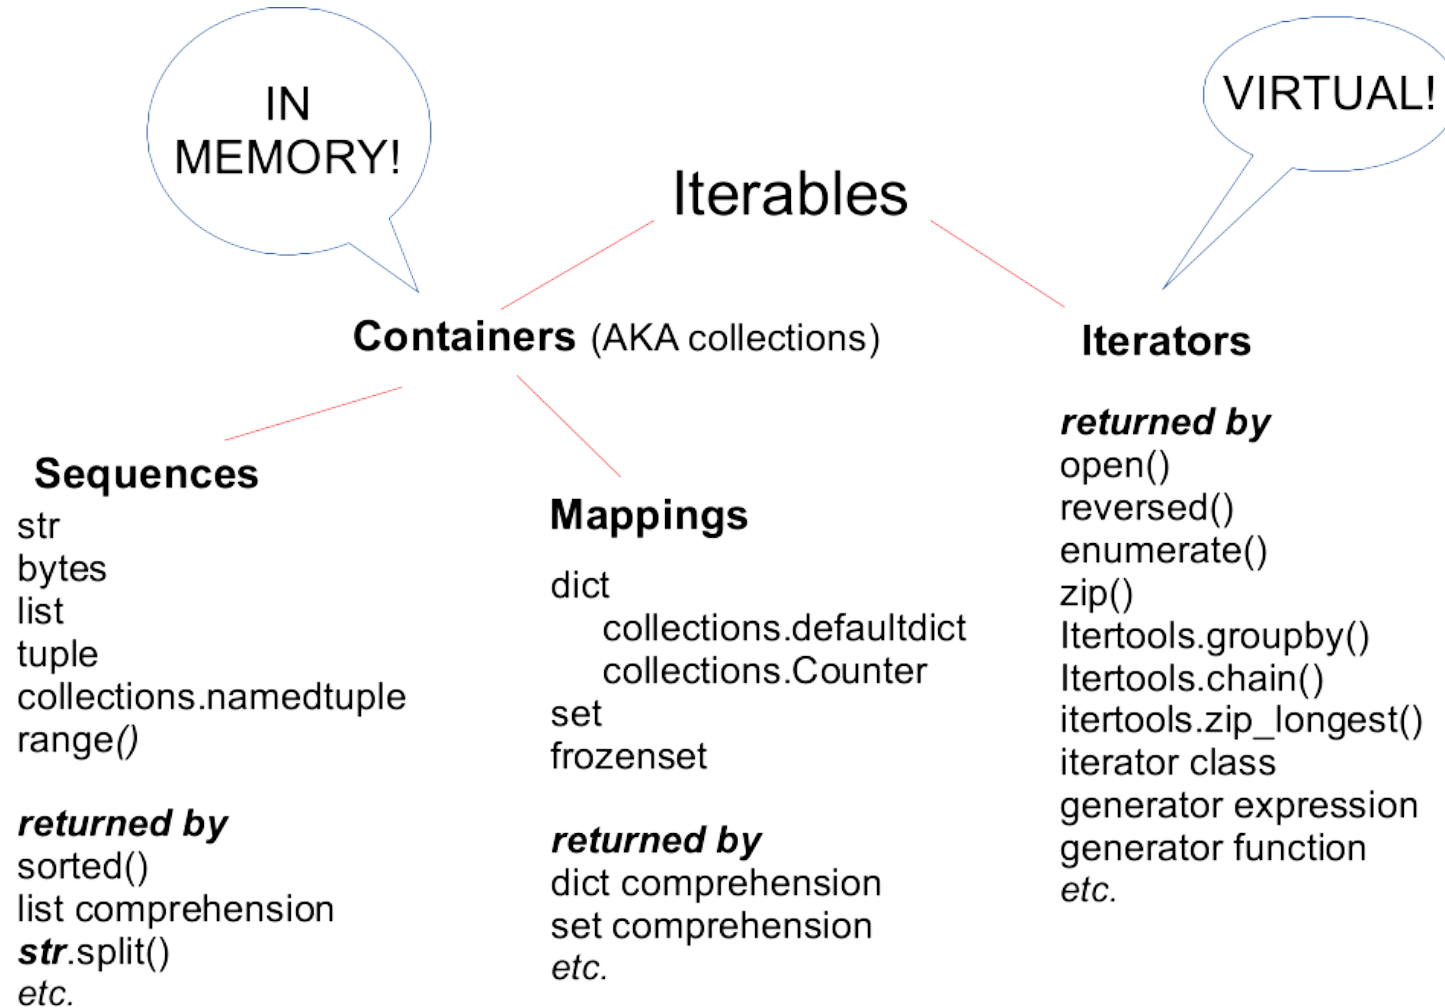

- dict comprehension

```
{KEY-EXPR: VALUE-EXPR for VAR ... in ITERABLE if CONDITION}
```

- set comprehension

```
{EXPR for VAR ... in ITERABLE if CONDITION}
```

Iterables

Containers

- All elements in memory
- Can be indexed with []
- Have a length

Builtin containers

Sequences

`list`

`tuple`

`string`

`bytes`

`range`

Mapping types

`dict`

`set`

`frozenset`

Iterators

- Virtual (no memory used for data)
- Lazy evaluation (JIT)
- Cannot be indexed with []
- Do not have a length
- One-time-use

Iterators returned by

- `open()`
- `enumerate()`
- `DICT.items()`
- `zip()`
- `reversed()`
- *generator expression or function*
- *iterator class*

Iterators

Function parameters

POSITIONAL

NAMED

Function parameters

POSITIONAL

NAMED

Argument passing

Passing by sharing

- Read-only reference is passed
- Mutables may be changed via reference
- Immutables may not be changed

```
def spam(x, y):  
    x = 5  
    y.append("ham")  
  
foo = 17  
bar = ["toast", "jam"]  
  
spam(foo, bar)
```

Variable Scope

builtin

`print()`
`len()`

global

`COUNT = 0`
`LIMIT = 1`

local

```
def spam(ham):  
    eggs = 5  
    print(eggs)  
    print(COUNT)
```

Variable scope

```
ALPHA = 10

def spam(beta):
    gamma = 20
    print(ALPHA)
    print(beta)
    print(gamma)

spam(1234)
```

BUILTIN

GLOBAL

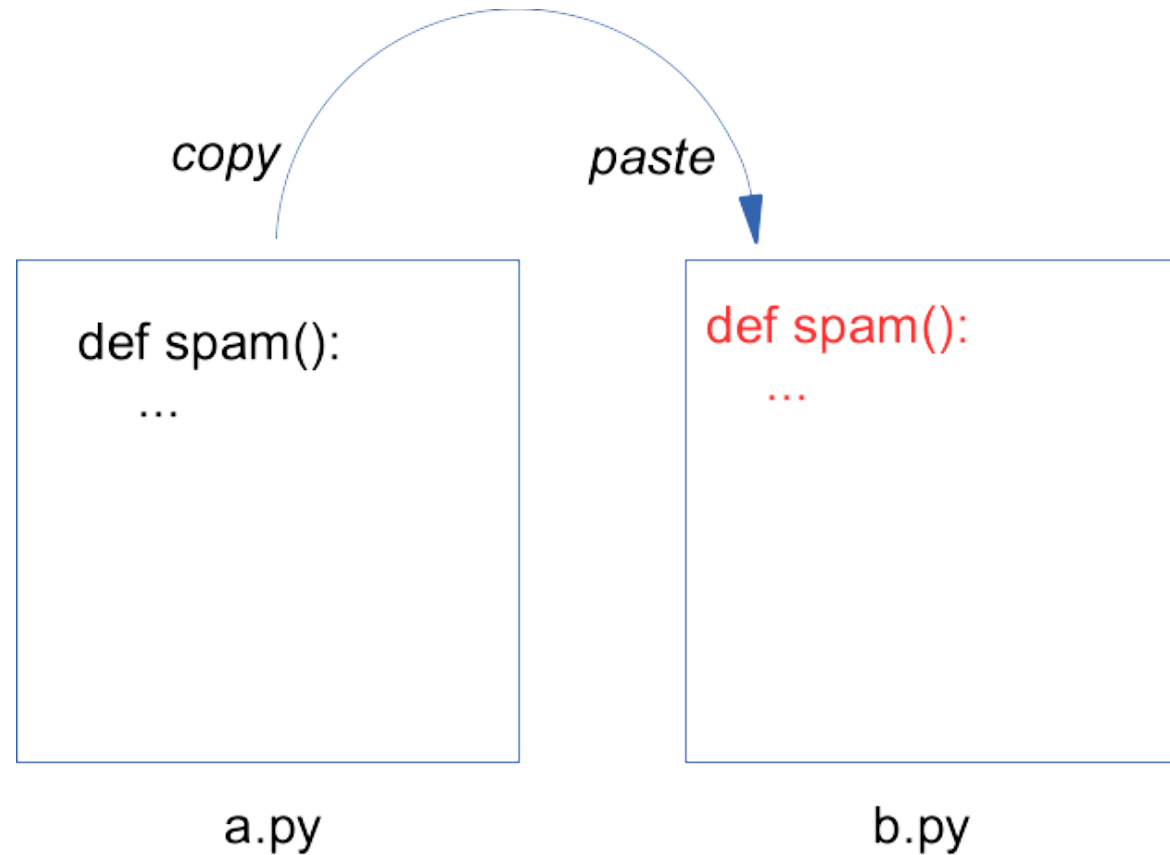

LOCAL

Copy/pasting functions

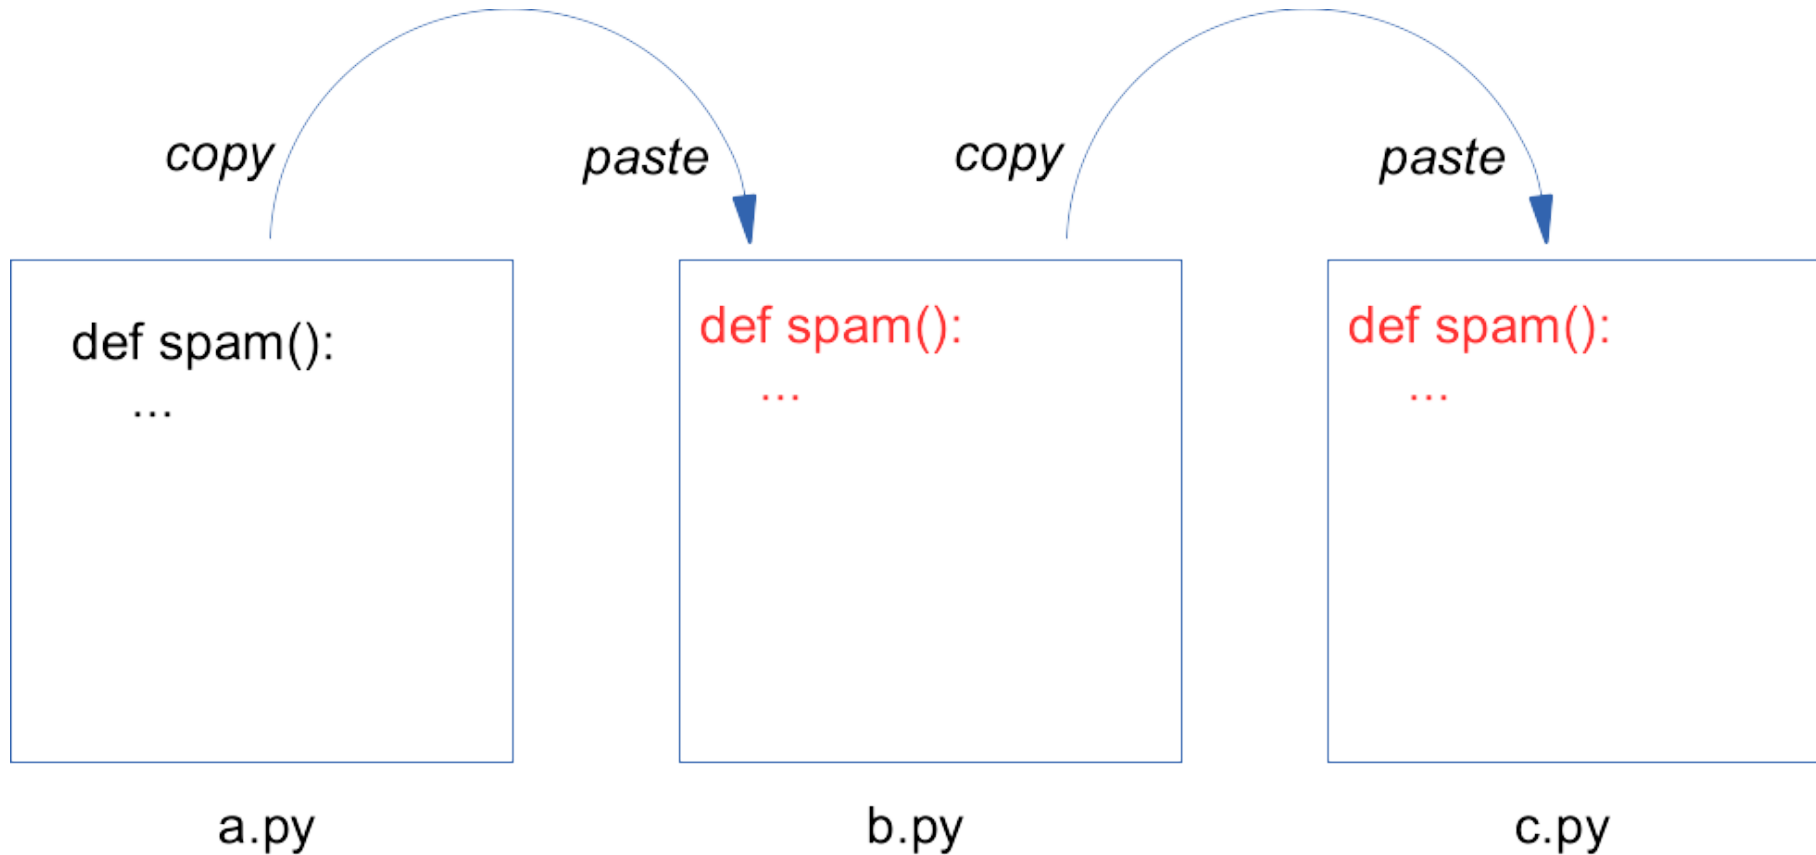

```
def spam():  
    ...
```

a.py

Copy/pasting functions

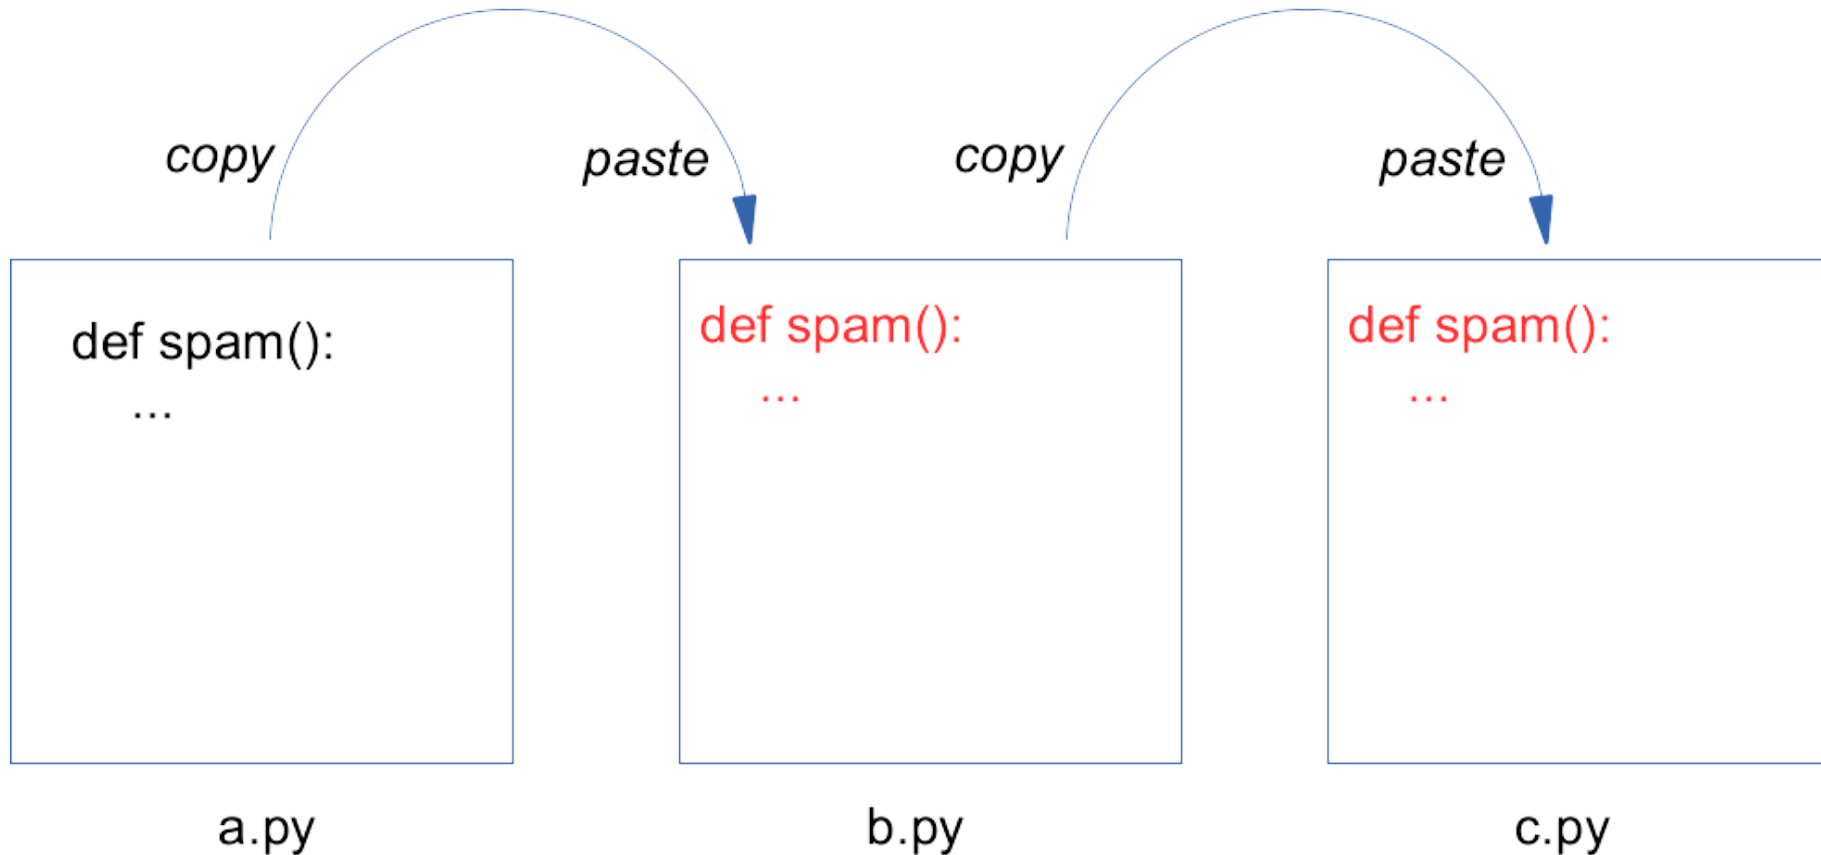

Copy/pasting functions

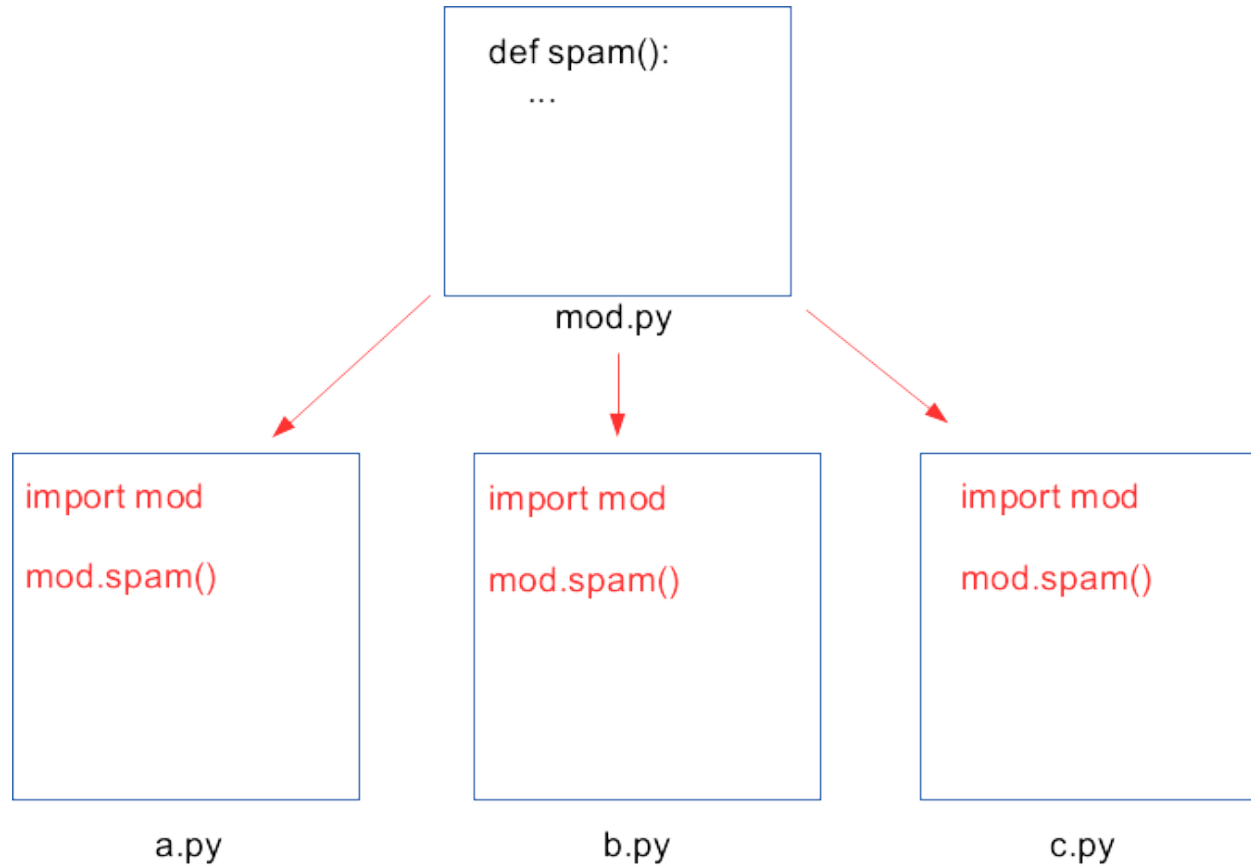

Copy/pasting functions

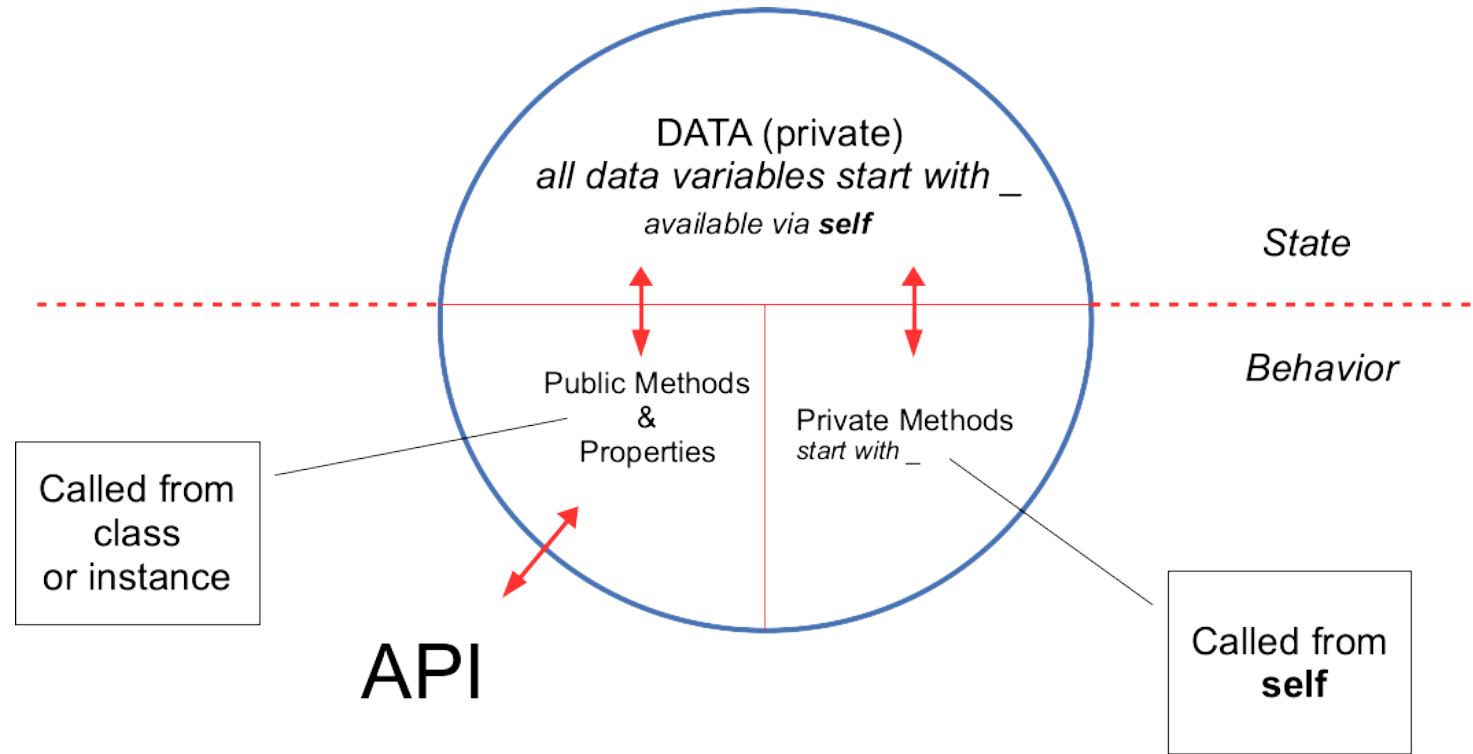

DON'T DO THIS!!

Using a module

A Python Class

str() vs repr()

str()	repr()
For humans	How to reproduce object
"Informal" form	"Official" form
Info about object	Code to create object
If undefined, uses repr()	If undefined, uses object.__repr__()

Decorators Save Typing

Instead of

```
def spam():  
    pass  
  
spam = deco(spam)
```

use

```
@deco  
def spam():  
    pass
```

spam is only typed once, instead of 3 times

Decorator Syntax

```
@DECORATOR  
def some_function():  
    pass
```

same as

```
some_function = DECORATOR(some_function)
```

Implementation

```
def DECORATOR(original_function):  
    @wraps(original_function)  
    def WRAPPER(*args, **kwargs):  
        # add code here  
        result = original_function(*args, **kwargs)  
        return result  
    return WRAPPER
```

Decorator with parameters

```
@DECORATOR(param, ...)  
def some_function():  
    pass
```

same as

```
some_function = DECORATOR(param, ...)(some_function)
```

Implementation

```
def DECORATOR(param, ...):  
    def WRAPPER_FACTORY(original_function):  
        @wraps(original_function)  
        def WRAPPER(*args, **kwargs):  
            # add code here using decorator params  
            result = original_function(*args, **kwargs)  
            return result  
        return WRAPPER  
    return WRAPPER_FACTORY
```

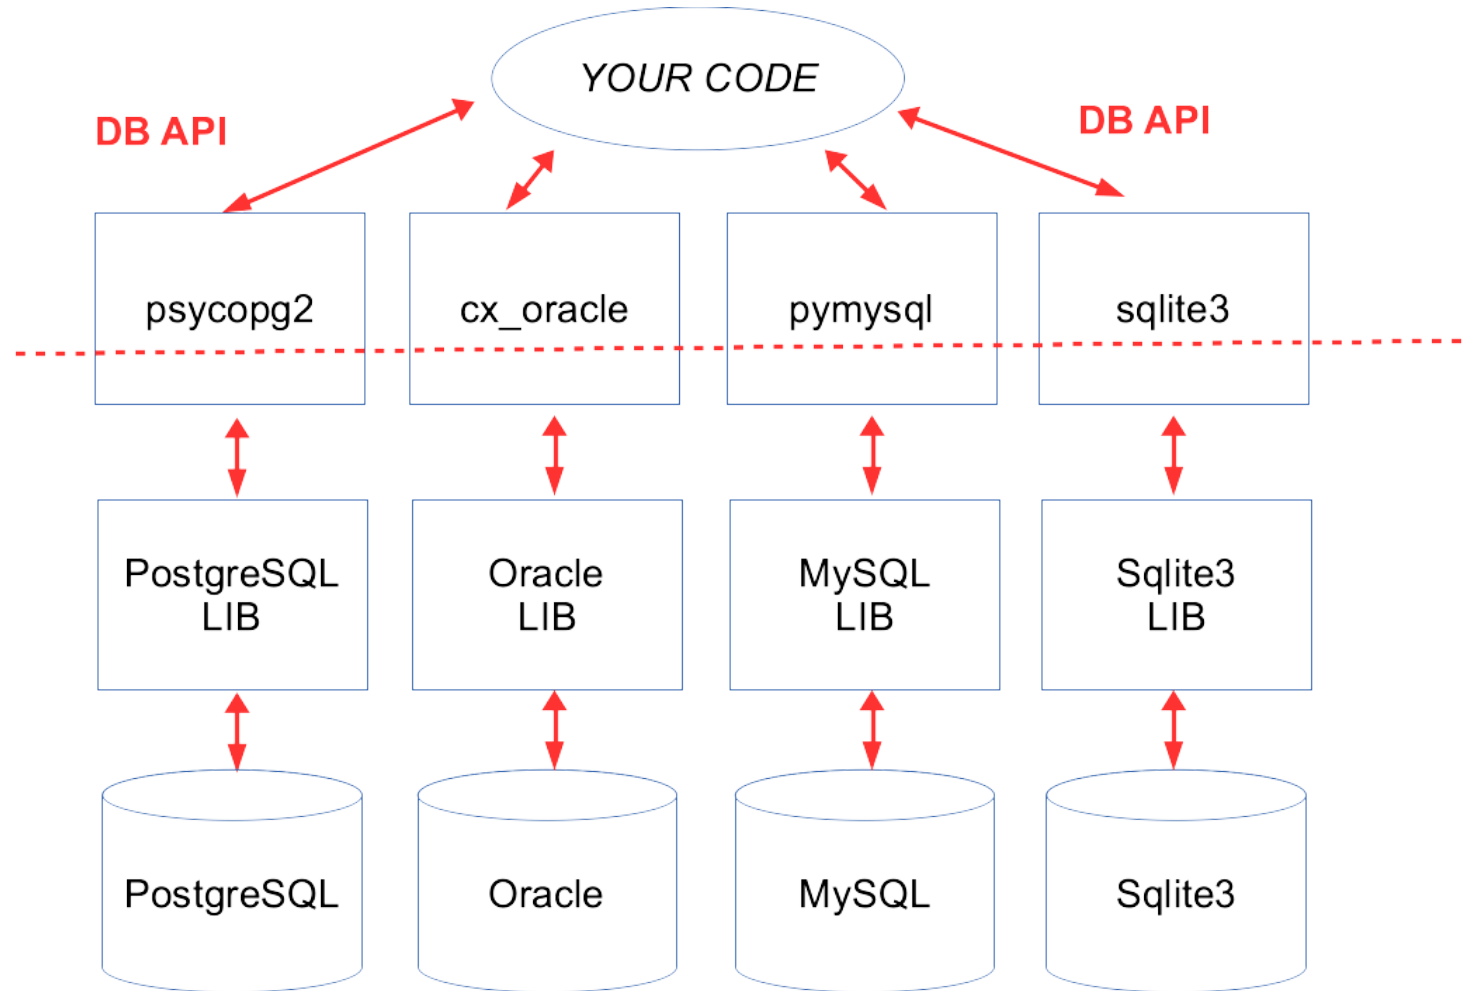

pyreverse (classes)

pyreverse (packages)

Python DB Interface

Python DB API

- `conn = package.connect(server, db, user, password, etc.)`
- `cursor = conn.cursor()`
- `num_lines = cursor.execute(query)`
- `num_lines = cursor.execute(query-with-placeholders, param-iterable))`
- `all_rows = cursor.fetchall()`
- `some_rows = cursor.fetchmany(n)`
- `one_row = cursor.fetchone()`
- `conn.commit()`
- `conn.rollback()`

PyQt Designer Workflow

Concurrency

ElementTree

XML

```
<presidents>
  <president term="1">
    <first>George</first>
    <last>Washington</last>
  </president>
  <president term="2">
    <first>John</first>
    <last>Adams</last>
  </president>
</presidents>
```

ElementTree

```
Element
  tag="presidents"
  Element {"term": "1" }
    tag="president"
    Element
      tag="first"
      text="George"
    Element
      tag="last"
      text="Washington"
  Element {"term": "2" }
    tag="president"
    Element
      tag="first"
      text="John"
    Element
      tag="last"
      text="Adams"
```

Configuring Visual Studio code

Some settings to make programming with Python easier

Auto-save

- Search for "auto save"
- Set to *after delay*

Launch folder

- Search for "execute in"
- Check box for **Python > Terminal: Execute in File Dir**

Minimap

- Search for "minimap enabled"
- Uncheck **Editor > Minimap: Enabled**

Editor font size

- Search for "editor font size"
- Set **Editor: Font Size** to desired size

Terminal font size

- Search for "terminal font size"
- Set **Terminal: Font Size** to desired size

Themes

- Got to **File > Preferences > Theme > Color Theme**
- Select new theme as desired
